# AERODYNAMIC PERFORMANCE OF A 1.20-PRESSURE-RATIO FAN STAGE DESIGNED FOR LOW NOISE

by George W. Lewis, Jr., and Royce D. Moore

Lewis Research Center

## SUMMARY

A 51-centimeter-diameter axial-flow fan stage with a design tip speed of 228.6 meters per second was tested. Detailed radial surveys of the flow conditions at the rotor blade inlet and outlet and the stator blade outlet were made. The flow and performance parameters were calculated at stations corresponding to the rotor and stator leading and trailing edges across nine selected blade elements. The radial surveys were made over the stable operating flow range at rotative speeds from 80 to 120 percent of design speed.

Rotor peak efficiency at design speed was 0.935 and was obtained at a weight flow of 29.8 kilograms per second; the pressure ratio was 1.206. Peak stage efficiency was 0.824 at the same flow rate and a pressure ratio of 1.186. The radial distribution of rotor performance parameters at peak efficiency and design speed indicated excellent agreement with design values.

## INTRODUCTION

A research program on axial-flow fans and compressors for advanced airbreathing engines is currently being conducted at the NASA Lewis Research Center. This program is primarily directed toward providing the technology required to permit reductions in the size and weight of fans and compressors while maintaining high levels of performance. In support of this program experimental studies are being conducted on fan stages suitable for use in engines for quiet powered-lift aircraft using the externally blown flap (refs. 1 to 3). The externally blown flap aircraft will require a large flow of relatively low velocity air for effective lift augmentation and low noise during takeoff and landing (ref. 4).

To meet the low noise requirements, the fans will be required to have low tip speed and low pressure ratio. In addition, the fan blading can be designed to reduce noise.

For fans, in general, the rotor blade passing frequency noise appears to be the dominant noise source; the noise is caused by the interaction of the rotor blade wakes with the downstream stator blades. Thus spacing the stator further downstream tends to reduce the noise levels. Setting the stator incidence angles to minimize the fluctuating lift experienced by the stator blades due to the rotor wakes is another method favorable to reducing noise (ref. 5). Increasing the ratio of the number of stator blades to rotor blades has also been shown to be effective in reducing noise.

The fan stage presented herein was designed using the minimum fluctuating lift concept to set the stator incidence angles. The stators were spaced four rotor tip chords downstream of the rotor. Acoustic data obtained with a 1.83-meter-diameter model of this fan was presented in reference 6.

This report presents the aerodynamic performance of a 51-centimeter-diameter model of the 1.20-pressure-ratio fan stage. It has been designated stage 54-54 herein. Data were obtained over the stable operating range for five rotative speeds from 80 to 120 percent of design speed. Blade-element survey data were obtained at nine radial positions. The data presented in this report are in tabular and in machine plotted form. The symbols and equations are defined in appendixes A and B. The definitions and units used for the tabular data are defined in appendix C.

## AERODYNAMIC DESIGN

The aerodynamic design for this fan stage is presented in reference 6. It incorporates features to reduce the noise caused by rotor-stator interactions. Basically, the stator blades were spaced four rotor tip chords downstream of the rotor, and the stator incidence angles were chosen to minimize the magnitude of lift fluctuations experienced by the stator blades due to the passing rotor wakes.

Both the rotor and stator blades were designed using multiple-circular-arc blade profiles. The overall design parameters for stage 54-54 are listed in table I, and the flow path is shown in figure 1. The stage was designed for an overall pressure ratio of 1.201 and an efficiency of 0.882 at a flow rate of 30.55 kilograms per second (182.3  $\text{kg/sec}/\text{m}^2$  of annulus area). The design tip speed was 228.6 meters per second. The blade-element design parameters for rotor 54 are presented in table II. The rotor was designed for a distribution of total pressure ratio which varies from 1.218 at the tip to 1.162 at the hub. The stator blade-element design parameters are given in table III. The blade geometries of the rotor and stator are presented in tables IV and V. The rotor tip solidity was 1.188, and the stator tip solidity was 1.00. This resulted in 42 rotor blades with an aspect ratio of 3.90 and 50 stator blades with an aspect ratio of 3.42. The stator blades had large turning on the forward portion of the blade suction surface as indicated by the high x-factors (greater than 1.0). The high x-factors resulted from an

attempt to obtain a uniform radial variation in area ratio over the height of the blade passage.

## APPARATUS AND PROCEDURE

### Compressor Test Facility

The compressor stage was tested in the Lewis single-stage compressor facility, which is described in detail in reference 7. A schematic diagram of the facility is shown in figure 2. Atmospheric air enters the test facility at an inlet located on the roof of the building and flows through the flow-measuring orifice and into the plenum chamber upstream of the test stage. The air passes through the experimental compressor stage into the collector and the vacuum exhaust system.

### Test Stage

Photographs of the rotor and stator are presented in figures 3 and 4. The rotor blades were pin mounted in the hub. The nonrotating radial tip clearance of the rotor was a nominal 0.05 centimeter at ambient conditions. The stator blades were mounted in the outer casing and supported by a small retaining ring at the hub.

### Instrumentation

The compressor weight flow was determined from measurements on a calibrated thin-plate orifice. The orifice air temperature was determined from an average of two Chromel-Constantan thermocouple readings.

Radial surveys of the flow were made upstream of the rotor, between the rotor and the stator, and downstream of the stator (fig. 1). The survey probes are shown in figure 5. Total pressure, total temperature, and flow angle were measured with the combination probe (fig. 5(a)), and static pressure was measured with an 8° C-shaped wedge probe (fig. 5(b)). Each probe was positioned with a null-balancing, stream-directional sensitive control system that automatically alined the probe to the direction of the flow. The probes were angularly prelined in an air tunnel. The probe thermocouple material was Chromel-Constantan. Two combination probes and two wedge static probes were used at each of the measuring stations.

Inner and outer wall static pressure taps were located at the same axial stations as the survey probes. The circumferential locations of both types of survey probes, along

with inner and outer wall static pressure taps, are shown in figure 6. The combination probes downstream of the stator (station 3) were circumferentially traversed one stator blade passage ( $7.2^{\circ}$ ) counterclockwise from the nominal values shown. All pressures were obtained with calibrated strain-gage transducers.

An electronic speed counter, in conjunction with a magnetic pickup, was used to measure rotative speed (rpm).

The estimated errors of the data based on inherent accuracies of the instrumentation and recording system are as follows:

|  |       |
|--|-------|
| Weight flow, kg/sec . . . . .                              | ±0.3  |
| Rotative speed, rpm . . . . .                              | ±30   |
| Flow angle, deg . . . . .                                  | ±1    |
| Temperature, K . . . . .                                   | ±0.6  |
| Rotor-inlet total pressure, N/cm <sup>2</sup> . . . . .    | ±0.01 |
| Rotor-outlet total pressure, N/cm <sup>2</sup> . . . . .   | ±0.10 |
| Stator-outlet total pressure, N/cm <sup>2</sup> . . . . .  | ±0.10 |
| Rotor-inlet static pressure, N/cm <sup>2</sup> . . . . .   | ±0.04 |
| Rotor-outlet static pressure, N/cm <sup>2</sup> . . . . .  | ±0.07 |
| Stator-outlet static pressure, N/cm <sup>2</sup> . . . . . | ±0.07 |

An indication of the consistency of the data can be observed by comparing the integrated weight flow at each measuring station to the orifice weight flow in table VI.

### Test Procedure

The stage survey data were taken over a range of weight flows from maximum flow to the near-stall conditions at speeds from 80 to 120 percent. For each speed radial surveys were taken at five or more weight flows. Data were recorded at nine radial positions for each weight flow.

At each radial position the two combination probes behind the stator were circumferentially traversed to nine different locations across the stator gap. The wedge probes were set at midgap because preliminary studies showed that the static pressure across the gap was constant. Values of pressure, temperature, and flow angle were recorded at each circumferential position at station 3. At the last circumferential position, values of pressure, temperature, and flow angle were also recorded at stations 1 and 2. All probes were then traversed to the next radial position, and the circumferential traverse procedure was repeated.

### Calculation Procedure

Measured total temperatures and total pressures were corrected for Mach number and streamline slope. These corrections were based on instrument probe calibrations given in reference 8. The stream static pressure was corrected for Mach number and streamline slope based on an average calibration for the type of probe used.

Because of the physical construction of the C-shaped static pressure wedges, it was not possible to obtain static pressure measurements at 5, 10, and 95 percent of span. The static pressure at 95 percent of span was obtained by assuming a linear variation in static pressure between the values at the inner wall and the probe measurement at 90 percent of span. A linear variation was also assumed between the static pressure measurements at the outer wall and the 15-percent span to obtain the static pressure at 5 and 10 percent of span.

At each radial position averaged values of the nine circumferential measurements of pressure, temperature, and flow angle downstream of the stator (station 3) were obtained. The nine values of total temperature were mass averaged to obtain the stator-outlet total temperature presented. The nine values of total pressure were energy averaged. The measured values of pressure, temperature, and flow angle were used to calculate axial and tangential velocities at each circumferential position. The flow angles presented for each radial position were calculated based on these mass-averaged axial and tangential velocities. To obtain the overall performance, the radial values of total temperature were mass averaged and the values of total pressure were energy averaged. At each measuring station the integrated weight flow was computed based on the radial survey data.

The data, measured at the three measuring stations, have been translated to the blade leading and trailing edges by the method presented in reference 9.

The stall weight flow was not obtained because of a failure of several rotor blades at the conclusion of the blade-element tests.

Orifice weight flows, total pressures, static pressures, and temperatures were all corrected to standard-day conditions based on the rotor-inlet conditions.

### RESULTS AND DISCUSSION

The results from this investigation are presented in three main sections. The overall performance for the rotor and the stage are presented first. Radial distributions of several performance parameters are then presented for both the rotor and the stator. Blade-element data are presented for both rotor and stator. The data are computer plotted, and occasionally a data point is omitted because it falls outside the range of the parameters shown in the figure.

All the plotted data together with some additional performance parameters for the fan stage are presented in tabular form. The overall performance data are presented in table VI. The blade-element data are presented first for the rotor in table VII and then for the stator in table VIII. The definitions and units used for the tabular data are presented in appendix C.

### Overall Performance

The overall performance for rotor 54 and stage 54-54 are presented in figures 7 and 8. For both of these computer-plotted figures, data are presented for five speeds from 80 to 120 percent of design speed. Design-point values are shown as solid symbols on both figures.

Rotor. - The data of figure 7 indicate that the rotor met its overall design objective. The peak efficiency for rotor 54 was 0.935 at design speed. Peak efficiency was obtained at a flow rate of 29.75 kilograms per second and a pressure ratio of 1.206. There was no uniform trend of rotor efficiency with increasing tip speed. The inconsistency may be primarily due to the limitation in the inherent accuracy of temperature measurement. For this low pressure ratio fan, a 0.6 degree change in the temperature measurement results in an efficiency change of about 0.03.

Stage. - Overall efficiency of the stage was less favorable than that of the rotor. The stage peak efficiency was only 0.824. As with the rotor, peak efficiency occurred at a flow rate of 29.7 kilograms per second. At this flow rate stage pressure ratio was 1.183. Comparison of the stage and rotor temperature ratios at this flow rate indicate that three points in the difference in efficiency is due to the difference in temperature measurement.

### Radial Distributions

The radial distributions of several parameters are presented for design speed in figure 9 for rotor 54 and in figure 10 for stator 54. In each figure data are presented for three weight flows: near choke, near design, and near stall. The design values are shown by the solid symbols. Temperature-rise efficiency, total temperature ratio, total pressure ratio, suction-surface incidence angle, meridional velocity ratio, deviation angle, total loss parameter, total loss coefficient, and diffusion factor are presented as functions of percent span from the blade tip.

Rotor. - At a flow rate of 29.7 kilograms per second the radial distribution of all parameters closely approximates the design values. However, at the near-stall flow rate of 22.2 kilograms per second, losses in the region from midspan to the rotor tip increase sharply. The total temperature ratio, deviation angle, and diffusion factor are increased while meridional velocity is decreased in this region, indicating premature

suction surface flow separation and incipient stall.

Stator. - At the near design flow rate of 29.7 kilograms per second, the radial distribution of incidence angle to the stator blades is approximately equal to design (fig. 10). However, the stator deviation angles are from  $4^{\circ}$  to  $7^{\circ}$  greater than design values. Although the diffusion factor is less than or equal to design over the blade span, higher than design losses are measured in both the tip and hub regions. Part of these total pressure losses can be attributed to increased wall boundary-layer flow and mixing losses resulting from the greater distance between the rotor exit and the stator inlet. The total pressure losses may also be due to premature flow separation on the suction surface as a result of the large turning on the forward portion of the blades (high x-factors).

#### Variation with Incidence Angle

The variations of selected blade-element parameters with suction surface incidence angle are presented in figure 11 for rotor 54 and in figure 12 for stator 54. The data are presented for 80, 100, and 120 percent of design speed for blade-element locations of 5, 10, 30, 50, 70, 90, and 95 percent span from the rotor blade tip. Design values are shown as solid symbols.

Rotor. - The blade-element data indicates that the rotor experimental results closely approximate the design values at design incidence angle. The minimum losses occurred at design incidence angle except near the hub (90 and 95 percent span) where the minimum loss occurred at higher incidence angles. The high total pressure losses observed in the tip region at high incidence angles of 80 and 100 percent of design speed are indicative of incipient stall.

Stator. - The variations of stator velocity ratio, deviation angle, losses, and diffusion factor with stator incidence angle are essentially independent of inlet Mach number (percent design speed). The deviation angle is greater than design for all span locations. For 5, 10, 30, and 95 percent spans minimum losses were greater than design values and minimum-loss incidence angles were less than design.

The overall results indicate that the stator losses caused a decrease in overall efficiency of over 10 percent. Probable causes of the high stator losses were discussed in the Radial Distributions section. The data from this stator and that of reference 3 indicate that minimum losses in the tip region occurred at negative incidence angles. The fact that this stator was designed for positive incidence angle in the tip region may have also contributed to the high losses.

#### SUMMARY OF RESULTS

This report presents the aerodynamic design and both the overall and blade-element

performances of a 51-centimeter-diameter fan stage having a design pressure ratio of 1.20 and tip speed of 228.6 meters per second. This stage was investigated to evaluate the effects of low noise design constraints on the aerodynamic performance of fan stages. Radial surveys of the flow condition at the rotor inlet, between the rotor and stator, and at the stator outlet were made over the stable operating flow range of the stage at rotational speeds from 80 to 120 percent of design speed. Survey data were obtained at nine radial positions. The following principal results were obtained:

1. Rotor peak efficiency at design speed was 0.935 and occurred at a flow of 29.8 kilograms per second and a pressure ratio of 1.206.
2. At design speed the stage peak efficiency was 0.824 and occurred at a flow of 29.8 kilograms per second and a pressure ratio of 1.186.
3. The radial distribution of rotor performance parameters at peak efficiency and design speed indicated good agreement with the design values.
4. The data indicated high stator losses in the tip region.

## APPENDIX B

### EQUATIONS

**Suction-surface incidence angle**

$$i_{ss} = (\beta'_c)_{LE} - \kappa_{ss} \quad (B1)$$

**Mean incidence angle**

$$i_{mc} = (\beta'_c)_{LE} - (\kappa_{mc})_{LE} \quad (B2)$$

**Deviation angle**

$$\delta^0 = (\beta'_c)_{TE} - (\kappa_{mc})_{TE} \quad (B3)$$

**Diffusion factor**

$$D = 1 - \frac{V'_{TE}}{V'_{LE}} + \left| \frac{(rV_\theta)_{TE} - (rV_\theta)_{LE}}{(r_{TE} + r_{LE}) \sigma(V'_{LE})} \right| \quad (B4)$$

**Total loss coefficient**

$$\bar{\omega} = \frac{(P'_{id})_{TE} - P'_{TE}}{P'_{LE} - p_{LE}} \quad (B5)$$

**Profile loss coefficient**

$$\bar{\omega}_p = \bar{\omega} - \bar{\omega}_s \quad (B6)$$

**Total loss parameter**

$$\frac{\bar{\omega} \cos (\beta'_m)_{TE}}{2\sigma} \quad (B7)$$

**Profile loss parameter**

$$\frac{\omega_p \cos (\beta'_m)_{TE}}{2\sigma} \quad (B8)$$

Adiabatic (temperature-rise) efficiency

$$\eta_{ad} = \frac{\left(\frac{P_{TE}}{P_{LE}}\right)^{(\gamma-1)/\gamma} - 1}{\frac{T_{TE}}{T_{LE}} - 1} \quad (B9)$$

Momentum-rise efficiency

$$\eta_{mom} = \frac{\left(\frac{P_{TE}}{P_{LE}}\right)^{(\gamma-1)/\gamma} - 1}{\frac{(UV_\theta)_{TE} - (UV_\theta)_{LE}}{T_{LE} C_p}} \quad (B10)$$

Equivalent weight flow

$$\frac{W\sqrt{\theta}}{\delta} \quad (B11)$$

Equivalent rotative speed

$$\frac{N}{\sqrt{\theta}} \quad (B12)$$

Weight flow per unit annulus area

$$\frac{\left(\frac{W\sqrt{\theta}}{\delta}\right)}{A_{an}} \quad (B13)$$

Weight flow per unit frontal area

$$\frac{\left(\frac{W\sqrt{\theta}}{\delta}\right)}{A_f} \quad (B14)$$

**Head-rise coefficient**

$$\frac{C_p T_{LE}}{U_{tip}^2} \left[ \left( \frac{P_{TE}}{P_{LE}} \right)^{(\gamma-1)/\gamma} - 1 \right] \quad (B15)$$

**Flow coefficient**

$$\left( \frac{V_z}{U_{tip}} \right)_{LE} \quad (B16)$$

**Polytropic efficiency**

$$\eta_p = \frac{\ln \left( \frac{P_{TE}}{P_{LE}} \right)^{(\gamma-1)/\gamma}}{\ln \frac{T_{TE}}{T_{LE}}} \quad (B17)$$

| <b>KTC</b>          | angle between blade mean camber line at transition point and meridional plane, deg      |
| <b>LOSS COEFF</b>   | loss coefficient (total defined by eq. (B5) and profile defined by eq. (B6))            |
| <b>LOSS PARAM</b>   | loss parameter (total defined by eq. (B7) and profile defined by eq. (B8))              |
| <b>MERID</b>        | meridional  |
| <b>MERID VEL R</b>  | meridional velocity ratio   |
| <b>OUT</b>          | outlet (trailing edge of blade)   |
| <b>PERCENT SPAN</b> | percent of blade span from tip at rotor outlet  |
| <b>PHISS</b>        | suction-surface camber ahead of assumed shock location, deg                             |
| <b>PRESS</b>        | pressure, N/cm <sup>2</sup>   |

|                  |   |
|------------------|---|
| PROF             | profile   |
| RADI             | radius, cm  |
| REL              | relative to the blade   |
| RI               | inlet radius (leading edge of blade), cm  |
| RO               | outlet radius (trailing edge of blade), cm  |
| RP               | radial position   |
| RPM              | equivalent rotative speed, rpm  |
| SETTING ANGLE    | angle between aerodynamic chord and meridional plane, deg   |
| SOLIDITY         | ratio of aerodynamic chord to blade spacing   |
| SPEED            | speed, m/sec  |
| SS               | suction surface   |
| STREAMLINE SLOPE | slope of streamline, deg  |
| TANG             | tangential  |
| TEMP             | temperature, K  |
| TI               | thickness of blade at leading edge, cm  |
| TM               | thickness of blade at maximum thickness, cm   |
| TO               | thickness of blade at trailing edge, cm   |
| TOT              | total   |
| TOTAL CAMBER     | difference between inlet and outlet blade mean camber lines, deg  |
| VEL              | velocity, m/sec   |
| WT FLOW          | equivalent weight flow, kg/sec  |
| X FACTOR         | ratio of suction-surface camber ahead of assumed shock location of a multiple circular arc blade section to that of a double circular arc blade section |
| ZIC              | axial distance to blade leading edge from inlet, cm   |
| ZMC              | axial distance to blade maximum thickness point from inlet, cm  |
| ZOC              | axial distance to blade trailing edge from inlet, cm  |
| ZTC              | axial distance to transition point from inlet, cm   |

POSTMASTER : If Undeliverable (Section 158  
Postal Manual) Do Not Return

*"The aeronautical and space activities of the United States shall be conducted so as to contribute . . . to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof."*

—NATIONAL AERONAUTICS AND SPACE ACT OF 1958

## NASA SCIENTIFIC AND TECHNICAL PUBLICATIONS

**TECHNICAL REPORTS:** Scientific and technical information considered important, complete, and a lasting contribution to existing knowledge.

**TECHNICAL NOTES:** Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

**TECHNICAL MEMORANDUMS:** Information receiving limited distribution because of preliminary data, security classification, or other reasons. Also includes conference proceedings with either limited or unlimited distribution.

**CONTRACTOR REPORTS:** Scientific and technical information generated under a NASA contract or grant and considered an important contribution to existing knowledge.

**TECHNICAL TRANSLATIONS:** Information published in a foreign language considered to merit NASA distribution in English.

**SPECIAL PUBLICATIONS:** Information derived from or of value to NASA activities. Publications include final reports of major projects, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

**TECHNOLOGY UTILIZATION PUBLICATIONS:** Information on technology used by NASA that may be of particular interest in commercial and other non-aerospace applications. Publications include Tech Briefs, Technology Utilization Reports and Technology Surveys.

*Details on the availability of these publications may be obtained from:*

**SCIENTIFIC AND TECHNICAL INFORMATION OFFICE**

**NATIONAL AERONAUTICS AND SPACE ADMINISTRATION**

**Washington, D.C. 20546**
